

Good morning Sir/Ma'am.

I am Vivek Dandotiya, currently pursuing B.Tech in Computer Science and Engineering at Lovely Professional University.

I enjoy building technology solutions and solving technical problems. Over the past few years, I have worked on full-stack web development projects, including a real-time chat application using React, Node.js, MongoDB, and Socket.io, as well as a MediCare online medical store developed using Laravel and MySQL.

Through these projects, I gained practical experience in APIs, databases, debugging, troubleshooting, and problem-solving, which are areas that particularly interest me.

Apart from technical skills, I enjoy learning new technologies, collaborating with teams, and taking ownership of tasks. I believe my combination of technical knowledge, adaptability, and communication skills makes me a strong candidate for the Software Support Engineer role.

Thank you, and I look forward to discussing my experience further.

1. Questions from Chat App Project (Highest Probability)

Explain your Chat App.

Answer:

It is a real-time chat application built using React.js, Node.js, Express.js, MongoDB, and Socket.io. Users can register, login, and communicate instantly through WebSocket-based

messaging.

Why did you use Socket.io?

Answer:

Socket.io enables real-time bidirectional communication between client and server, making instant messaging possible.

Difference between REST API and Socket.io?

Answer:

REST API	Socket.io
Request-Response	Real-time communication
HTTP Based	WebSocket Based
Not Instant	Instant Updates

How are messages stored?

Answer:

Messages are stored in MongoDB and retrieved when users open their chats.

How does authentication work?

Answer:

JWT tokens are used to authenticate users after login and protect routes.

What challenges did you face?

Good answer:

Managing real-time communication, handling authentication, and maintaining synchronization between users were some of the major challenges.

What is JWT?

Answer:

JWT (JSON Web Token) is used for secure authentication between client and server.

2. Questions from MediCare Project (Very Important)

Since this project is more business-oriented, GreyOrange may ask support-related questions from it.

Explain your MediCare Project.

Answer:

MediCare is an online medical store developed using Laravel, PHP, and MySQL. It supports role-based access for Admin, Staff, and Customers. Customers can browse medicines, place orders, and receive confirmations, while Admin and Staff manage inventory and products.

Why did you use Laravel?

Answer:

Laravel provides MVC architecture, built-in authentication, routing, middleware, and database management, which speeds up development.

What database did you use?

Answer:

MySQL.

What is MVC?

Answer:

MVC stands for Model-View-Controller. It separates business logic, user interface, and request handling.

What roles are available?

Answer:

Admin, Staff, and Customer.

How did you implement authentication?

Answer:

Laravel authentication system along with role-based authorization.

If customer says order is missing, what will you do?

Answer:

I would verify the order record in the database, check application logs, confirm payment status, and investigate the issue before resolving or escalating it.

3. Questions from Skills Section

What is React?

Answer:

React is a JavaScript library used for building interactive user interfaces using reusable components.

What is Node.js?

Answer:

Node.js is a JavaScript runtime that allows JavaScript to run on the server side.

What is Express.js?

Answer:

Express.js is a lightweight web framework for Node.js used to build APIs and web applications.

What is MongoDB?

Answer:

MongoDB is a NoSQL database that stores data in JSON-like documents.

Difference between MongoDB and MySQL?

MongoDB	MySQL
NoSQL	Relational
Document Based	Table Based
Flexible Schema	Fixed Schema

4. API Questions

Your CV mentions REST APIs.

What is API?

Answer:

API is a set of rules that allows applications to communicate with each other.

HTTP Methods

- GET → Fetch data
 - POST → Create data
 - PUT → Update data
 - DELETE → Delete data
-

Difference between GET and POST?

GET	POST
Retrieves Data	Sends Data
Data in URL	Data in Body

5. Testing Questions

Your CV mentions:

- Manual Testing
- Functional Testing
- Smoke Testing
- API Testing
- SQL Validation

What is Smoke Testing?

Answer:

Smoke Testing checks whether the main functionality of an application works correctly after deployment.

What is Functional Testing?

Answer:

Functional Testing verifies that software behaves according to requirements.

What is API Testing?

Answer:

API Testing validates API functionality, responses, and data handling.

6. GreyOrange Support-Based Questions

Customer says application is slow. What will you do?

Answer:

I will check logs, CPU usage, memory consumption, database performance, and network connectivity to identify the root cause.

Customer is angry. What will you do?

Answer:

I will stay calm, listen carefully, collect relevant information, provide updates, and work towards resolving the issue.

What is RCA?

Answer:

Root Cause Analysis is the process of identifying the actual cause of a problem instead of only fixing its symptoms.
